Title: The Influence of Large Language Models on Natural Language Understanding

Objective:

The objective of this project is to investigate the influence of large language models on natural language understanding. Specifically, we aim to explore how LLMs, such as OpenAI's GPT series and Google's BERT, are reshaping the landscape of NLU by excelling in context understanding, multitask learning, and text generation. By delving into these aspects, we seek to gain insights into the advancements made by LLMs in enhancing language comprehension and the challenges they may pose.

Initial Findings for the State of the Art:

Initial findings suggest that LLMs have significantly advanced the field of NLU by leveraging transformer architectures to capture contextual information and nuances in human language. They excel at tasks such as sentiment analysis, named entity recognition, and text summarization, surpassing traditional rule-based approaches. Moreover, LLMs demonstrate the ability to generalize across different tasks and domains through transfer learning, making them versatile and adaptable to various applications.

What We Would Like to Achieve:

At the end of this project, we aim to achieve a comprehensive understanding of the influence of LLMs on NLU. We seek to find how LLMs improve language understanding capabilities, address existing challenges, and shape the future of AI-powered language comprehension systems. By observing the improvements, limitations, and potential ethical considerations associated with LLMs, we aim to provide valuable results into their role in advancing NLU and inform future research and development efforts in this domain.

This project aims to shed light on the transformative impact of LLMs on natural language understanding, offering insights into their capabilities, challenges, and implications for the future of AI-powered language comprehension systems
